

DIM-0/10-2CH – 2 CHANNEL LOW VOLTAGE DIMMING MODULE

This is the 2 channel low voltage dimming module.

- Provide two channels of 0-10V dimming for up to (40) ballasts per channel (80 total).
- Combine a two-pole line voltage switching module and a two channel 0-10V dimming module. This completely disconnects the line voltage load from the source automatically when the dimmer is set to 0%.
- Dimming Modules communicate with the Master Interface to report:
 - The dimmer's current dimming level (0-100%)
 - The line source state (available or off)
 - The communication status (active / not available)
 - The module's "health" (if the module is defective)
- Interchangeable with all other RD style relay and dimming modules, providing a higher level of flexibility than currently available in the market
